

Porn does Not Incite Violence

Pornography is often blamed for causing, instigating, or inspiring violence in (especially) men against (mainly) women. However, studies used to demonstrate causation consistently fail to establish any direct links.

At most, studies show that those who may have violent or aggressive tendencies in real life prefer similar content in pornography, such as they might in mainstream movies or music—not that violent or aggressive pornography instigates real-world violence, or causes the development of violent tendencies.¹ Overall, there is a significant lack of good practice research that justifies the idea that porn causes violence.² On the contrary, numerous studies indicate that pornography consumption has positive effects on users, including greater sexual satisfaction and exploration, improved understanding of self and sexual health, increased open-mindedness towards sexual minorities, and diminished sexual anxiety.

- Studies regarding real world violence or crime only show correlation, not causation. In fact, other studies and data show that violence and sex crimes decrease with access to adult content.
- Many studies that purport to show violence in porn use overly broad categorization of acts (including spanking and dirty talk) and language (e.g., “drill”) that most would not consider indicative of violence.

We looked at some of the most common claims and studies to understand the disconnect.

Myth #1: Porn Increases Sexual Aggression

“Defenders of pornography have argued for decades that pornography provides individuals prone to sexual violence with an outlet for their desires. Common sense, however, ought to inform us that even if viewing pornography has a cathartic effect for some, it can also arouse or “incite” others.” — National Center for Sexual Exploitation

Does viewing porn cause harmful and negative attitudes towards women?

No. At least not according to the research. While some studies show that those with sexually aggressive or violent tendencies are also consumers of porn, none have actually shown that porn has in any way influenced those attitudes, or that viewing such content leads to increased sexual aggression or misogyny. Studies found no correlation between watching pornographic videos and negative attitudes towards women or rape,^{3,4} This is further contraindicated by studies that show people who are porn viewers tend to have more egalitarian beliefs and greater positive attitudes towards women⁵. In fact, studies found that viewers of pornography specifically had more egalitarian attitudes toward women occupying positions of power and women working outside the home than nonusers.⁶ However, there was no difference between porn users and nonusers in their view on traditional family roles or their own self-identification as a feminist.⁷

Myth #2: Porn Leads to an Increase in Sex Crimes

"Pornography fuels sexual violence. In a society in which male violence against women and girls is rampant, combatting the harms of pornography should be front and centre of policy and strategy against sexual violence ... It's now high time that Government acted and recognised the damage caused by the pornography industry to the lives and the safety of women. — Dame Diana Johnson, Pornography Regulation: The Case for Parliamentary Reform (2023)

Does porn viewership lead to an increase of committing sex crimes?

No. Porn has not been shown to correlate with an increase in sex crimes, and in some cases actually correlated with a decrease in sex crimes. A scientific review of research found that as pornography has become more available, sex crimes have either decreased or not changed.⁸ In fact, as porn viewership and access to porn online has increased, the rate of rape per population has actually decreased⁹

Many studies find correlations between sex crime offenders and viewership of more pornography, but there is little evidence that viewing violent porn actually causes sex crimes. An oft-cited study from the 1980s focused specifically on sex offenders and found that they watched higher rates of violent pornography, but was not able to establish that viewing such content resulted in more crime.¹⁰

- Research does not currently suggest that watching consensual sex acts could lead to committing non-consensual behavior in real life.¹¹
- People's preference of porn is not indicative of the type of sex or sexual acts they enjoy in real life and there are marked differences in one's sexual preference between in-person sexual behavior, fantasy, and porn.¹²

Myth #3: Online Porn is Full of Violence

“One team of researchers with the same question analyzed hundreds of the most popular porn scenes and found that 88.2% contained physical violence or aggression while 48.7% contained verbal aggression.” — Fight the New Drug

Is online porn full of violence?

No. While numerous studies have attempted to show that online porn is predominantly or excessively violent, they only achieve those headline numbers by coding common terms (“drill”) and activities (spanking, dirty talk) as indicators of violence. Further, they fail to differentiate between consensual activities and actual violence. Many of these allegedly aggressive acts fall under the category of BDSM, which can actually be utilized to heal sexual trauma and promote sexual empowerment^{13,14,15}

For example, one study found 88.2% of scenes analyzed contained “physical aggression” and 48.7% contained “verbal aggression” both of which were defined with actions commonly engaged in, or were consensual kink and/or BDSM activities such as spanking hair pulling, bondage, and name calling. Researchers cite concern that 95.1% of the scenes showed recipients of these behaviors to be pleasurable or neutral, but the number just as easily indicates that the activity was consensual and pleasurable.¹⁶

In a 2021 study in the Journal of Criminology, researchers claimed to find that 12% of videos featured keywords suggesting sexual violence. But the study coded common words such as “rough,” “drill,” “pound” and “stepmother.”¹⁷

In both studies, keywords that describe (“rape” “assault” “punch”) or content that purport to show actual, non-consensual violence were next to non-existent.

Policy suggestions:

Pornography is often used as a scapegoat for sexism and sexual violence, or as a pretext for censorship of sexual health or education. If we truly want to stop sexual assault and violence, there are actually effective methods of prevention.

- Education about the consent, parameter setting, and after-care present in more aggressive sexual behaviors¹⁸
- Encourage the inclusion of pleasure, self-exploration, and consent instead of just risk avoidance or abstinence-only education in state legislation^{19 20}
- Fund efforts that center media and porn literacy education²¹
- Limit censorship of online and print materials that offer medically-accurate or controversial information about sexual health, bodily autonomy, and consent²²
